

## DENTAL CLINIC

# Negative Pressure Infection Control Room

### What is a negative pressure room?

Air pressure inside negative pressure rooms is less than the air pressure outside, preventing contaminated air particles inside the room from escaping when someone opens the door.

Exhaust systems are installed in these rooms to extract the contaminated air.

infection control  
requirements

### Benefits

- ✓ Protects the health of staff and patients
- ✓ Minimises aerosol transmission risk
- ✓ Patients feel safer visiting your clinic
- ✓ Beat the rush before it's legally required and avoid delays or clinic downtime.

### Negative Pressure Room Inclusions

At Armitage we can supply and **install an inline ceiling exhaust fan** which is ducted to the exterior of the building via the roof or soffit.

**Butterfly back flow vents** are also installed to prevent the ducted air re-entering rooms.

You'll receive

- **Form 15 compliance certificate** for building design or specification for each install
- **Form 16 inspection certificate/aspect certificate/ QBCC Licensee aspect certificate** for each install supplied.

All-inclusive upfront pricing.

Exceptional attention-to-detail

Qualified, licensed, and insured.

NO call out fee!

Trustworthy, professional and reliable.

On time, and on budget.

*The clinic air is changed over between every appointment using a high speed, high volume exhaust system. Not only does this minimise any aerosol transmission risk from dental procedures – it also protects the dental staff who often see a large number of patients in any one day.*
